Mathematical programming model

- In an *optimization problem*, the aim is to maximize (or minimize) a given quantity designated by the *objective* that depends on a finite number of variables.
- The variables might be independent or might be related between them through one or more *constraints*.
- A *mathematical programming problem* is an optimization problem such that the objective and the constraints are defined by mathematical functions and functional relations.
- A *mathematical programming model* describes a mathematical programming problem.

Mathematical programming model

For a given set of n variables $X = \{x_1, x_2, \dots, x_n\}$, the standard way of defining a Mathematical Programming Model is:

Minimize (or Maximize)

$$f(X)$$

Subject to:

$$g_i(X) \leq k_i, \quad i = 1, 2, \dots, m$$

(=)
(\geq)

where:

- m is the number of constraints
- $f(X)$ and all $g_i(X)$ are functions of the variables
- k_i are real constants

(Mixed Integer) Linear Programming model

- A Linear Programming (LP) model is a mathematical programming model where all variables $X = \{x_1, x_2, \dots, x_n\}$ are non-negative reals and $f(X)$ and $g_i(X)$ are linear functions:
 - functions in the form $a_1x_1 + a_2x_2 + \dots + a_nx_n$ where all a_i are real parameters.
- An Integer Linear Programming (ILP) model is an LP model where all variables $X = \{x_1, x_2, \dots, x_n\}$ are non-negative integers.
- A Mixed Integer Linear Programming (MILP) model is an LP model where some variables $X = \{x_1, x_2, \dots, x_n\}$ are non-negative integers and others are non-negative reals.

Illustrative example

Consider a transportation company that has been requested to deliver the following items to a particular destination:

Item i :	1	2	3	4	5	6
Revenue (r_i):	2.3	4.5	1.5	5.4	2.9	3.2
Size (s_i):	30	70	20	80	35	40

The company has 2 vans for item delivery:

- the first van has a capacity of 100
- the second van has a capacity of 60.

Since it is not possible to deliver all items with the 2 vans, the aim is to choose the items to be carried on each van to maximize the revenue.

Solving steps:

- 1st - define the ILP model of the optimization problem
- 2nd – solve the ILP model (using an available solver)

Illustrative example

Item i :	1	2	3	4	5	6
Revenue (r_i):	2.3	4.5	1.5	5.4	2.9	3.2
Size (s_i):	30	70	20	80	35	40

VARIABLES DEFINING THE PROBLEM:

- x_1 – Binary variable that, if is 1 in the solution, indicates that item 1 is delivered
- x_2 – Binary variable that, if is 1 in the solution, indicates that item 2 is delivered
- ...
- x_6 – Binary variable that, if is 1 in the solution, indicates that item 6 is delivered

- y_{1_1} – Binary variable that, if is 1 in the solution, indicates that item 1 is carried by first van
- y_{1_2} – Binary variable that, if is 1 in the solution, indicates that item 1 is carried by second van
- ...
- y_{6_1} – Binary variable that, if is 1 in the solution, indicates that item 6 is carried by first van
- y_{6_2} – Binary variable that, if is 1 in the solution, indicates that item 6 is carried by second van

Illustrative example

Item i :	1	2	3	4	5	6
Revenue (r_i):	2.3	4.5	1.5	5.4	2.9	3.2
Size (s_i):	30	70	20	80	35	40

INTEGER LINEAR PROGRAMMING (ILP) MODEL (in LP format):

The objective function is the total revenue
of the delivered items

Maximize

$$+ 2.3 x_1 + 4.5 x_2 + 1.5 x_3 + 5.4 x_4 + 2.9 x_5 + 3.2 x_6$$

Subject To

$$+ 30 y_{1_1} + 70 y_{2_1} + 20 y_{3_1} + 80 y_{4_1} + 35 y_{5_1} + 40 y_{6_1} \leq 100$$

$$+ 30 y_{1_2} + 70 y_{2_2} + 20 y_{3_2} + 80 y_{4_2} + 35 y_{5_2} + 40 y_{6_2} \leq 60$$

$$+ y_{1_1} + y_{1_2} - x_1 = 0$$

$$+ y_{2_1} + y_{2_2} - x_2 = 0$$

$$+ y_{3_1} + y_{3_2} - x_3 = 0$$

$$+ y_{4_1} + y_{4_2} - x_4 = 0$$

$$+ y_{5_1} + y_{5_2} - x_5 = 0$$

$$+ y_{6_1} + y_{6_2} - x_6 = 0$$

The total size of the items carried on each
van must be within the van capacity

If an item is carried in one van, then, the
item is delivered

Binary

$$x_1 x_2 x_3 x_4 x_5 x_6$$

$$y_{1_1} y_{1_2} y_{2_1} y_{2_2} y_{3_1} y_{3_2} y_{4_1} y_{4_2} y_{5_1} y_{5_2} y_{6_1} y_{6_2}$$

End

List of binary variables

Illustrative example – using CPLEX (1)

Starting CPLEX:

```
Welcome to IBM(R) ILOG(R) CPLEX(R) Interactive Optimizer 12.6.1.0  
  with Simplex, Mixed Integer & Barrier Optimizers  
5725-A06 5725-A29 5724-Y48 5724-Y49 5724-Y54 5724-Y55 5655-Y21

```

```
Type 'help' for a list of available commands.  
Type 'help' followed by a command name for more  
information on commands.
```

```
CPLEX>
```

Reading file 'exemplo.lp' on CPLEX:

```
CPLEX> read exemplo.lp  
Problem 'exemplo.lp' read.  
Read time = 0.01 sec. (0.00 ticks)  
CPLEX>
```

Illustrative example – using CPLEX (2)

Solving the problem on CPLEX:

CPLEX> optimize

	Node	Left	Objective	IInf	Best Integer	Cuts/ Best Bound	ItCnt	Gap
*	0+	0			1.5000	19.8000		---
*	0+	0			11.2000	19.8000		76.79%
	0	0	11.8286	1	11.2000	11.8286	4	5.61%
*	0+	0			11.5000	11.8286		2.86%
	0	0	cutoff		11.5000		4	0.00%

Elapsed time = 0.14 sec. (1.12 ticks, tree = 0.00 MB, solutions = 3)

Root node processing (before b&c):

Real time = 0.14 sec. (1.12 ticks)

Parallel b&c, 4 threads:

Real time = 0.00 sec. (0.00 ticks)

Sync time (average) = 0.00 sec.

Wait time (average) = 0.00 sec.

Total (root+branch&cut) = 0.14 sec. (1.12 ticks)

Solution pool: 4 solutions saved.

MIP - Integer optimal solution: Objective = 1.1500000000e+001

Solution time = 0.16 sec. Iterations = 4 Nodes = 0

Deterministic time = 1.12 ticks (7.17 ticks/sec)

Optimal solution value

Illustrative example – using CPLEX (3)

Displaying the values of the optimal solution:

Items 1, 2, 3 and 6
are selected to be
delivered

Items 1 and 2 are
carried by first van

Items 3 and 6 are
carried by second van

```
CPLEX> display solution variables -
Incumbent solution
Variable Name          Solution Value
x1                      1.000000
x2                      1.000000
x3                      1.000000
x6                      1.000000
y1_1                   1.000000
y2_1                   1.000000
y3_2                   1.000000
y6_2                   1.000000
All other variables in the range 1-18 are 0.
CPLEX>
```

Item i :	1	2	3	4	5	6
Revenue (r_i):	2.3	4.5	1.5	5.4	2.9	3.2
Size (s_i):	30	70	20	80	35	40

Illustrative example – mathematical notation

Parameters:

n – number of items r_i – revenue of delivering item i , with $i = 1, \dots, n$
 s_i – size of item i , with $i = 1, \dots, n$
 v – number of vans c_j – capacity of van j , with $j = 1, \dots, v$

Variables:

x_i – binary variable that is 1 if item i is delivered, $i = 1, \dots, n$
 y_{ij} – binary variable that is 1 if item i is carried on van j , $i = 1, \dots, n$ and $j = 1, \dots, v$

ILP model: Maximize $\sum_{i=1}^n r_i x_i$

Subject to:

$$\sum_{i=1}^n s_i y_{ij} \leq c_j \quad , j = 1 \dots v$$

$$\sum_{j=1}^v y_{ij} = x_i \quad , i = 1 \dots n$$

$$x_i \in \{0,1\} \quad , i = 1 \dots n$$

$$y_{ij} \in \{0,1\} \quad , i = 1 \dots n , j = 1, \dots v$$

Illustrative example – generating LP file with MATLAB

$$\text{Maximize } \sum_{i=1}^n r_i x_i$$

$$\sum_{i=1}^n s_i y_{ij} \leq c_j \quad , j = 1 \dots v$$

$$\sum_{j=1}^v y_{ij} = x_i \quad , i = 1 \dots n$$

$$x_i \in \{0,1\} , i = 1 \dots n$$

$$y_{ij} \in \{0,1\} , i = 1 \dots n , j = 1, \dots v$$

```

r= [2.3 4.5 1.5 5.4 2.9 3.2];
s= [30 70 20 80 35 40];
c= [100 60];
n= length(r);
v= length(c);
fid = fopen('exemplo.lp','wt');
fprintf(fid,'Maximize\n');
for i=1:n
    fprintf(fid,' + %f x%d',r(i),i);
end
fprintf(fid,'\nSubject To\n');
for j=1:v
    for i=1:n
        fprintf(fid,' + %f y%d_%d',s(i),i,j);
    end
    fprintf(fid,' <= %f\n',c(j));
end
for i=1:n
    for j=1:v
        fprintf(fid,' + y%d_%d',i,j);
    end
    fprintf(fid,' - x%d = 0\n',i);
end
fprintf(fid,'Binary\n');
for i=1:n
    fprintf(fid,' x%d\n',i);
    for j=1:v
        fprintf(fid,' y%d_%d\n',i,j);
    end
end
fprintf(fid,'End\n');
fclose(fid);

```

Illustrative example - using Gurobi on Internet (1)

- Prepare an ASCII file with the problem defined in LP format and compress it with Zip:

for example: exemplo.zip

- Go to <https://neos-server.org/neos/solvers/index.html>
- Select Mixed Integer Linear Programming tools
- Select Gurobi [[LP Input](#)]

Solving the server farm location problem with ILP

- We have a set of Autonomous Systems (ASs) and we aim to select a subset of ASs to connect one server farm on each selected AS.
- Only Tier-2 or Tier-3 ASs provide the Internet access service.
- The solution must guarantee that there is a path from each Tier-2 and Tier-3 ASs to at least one server farm with no more than one intermediate AS.

Server farm location problem: Notation and Variables

PARAMETERS:

n_1, n_2, \dots – IDs of Tier-2 and Tier-3 ASs (i.e., ASs where server farms can be connected to)

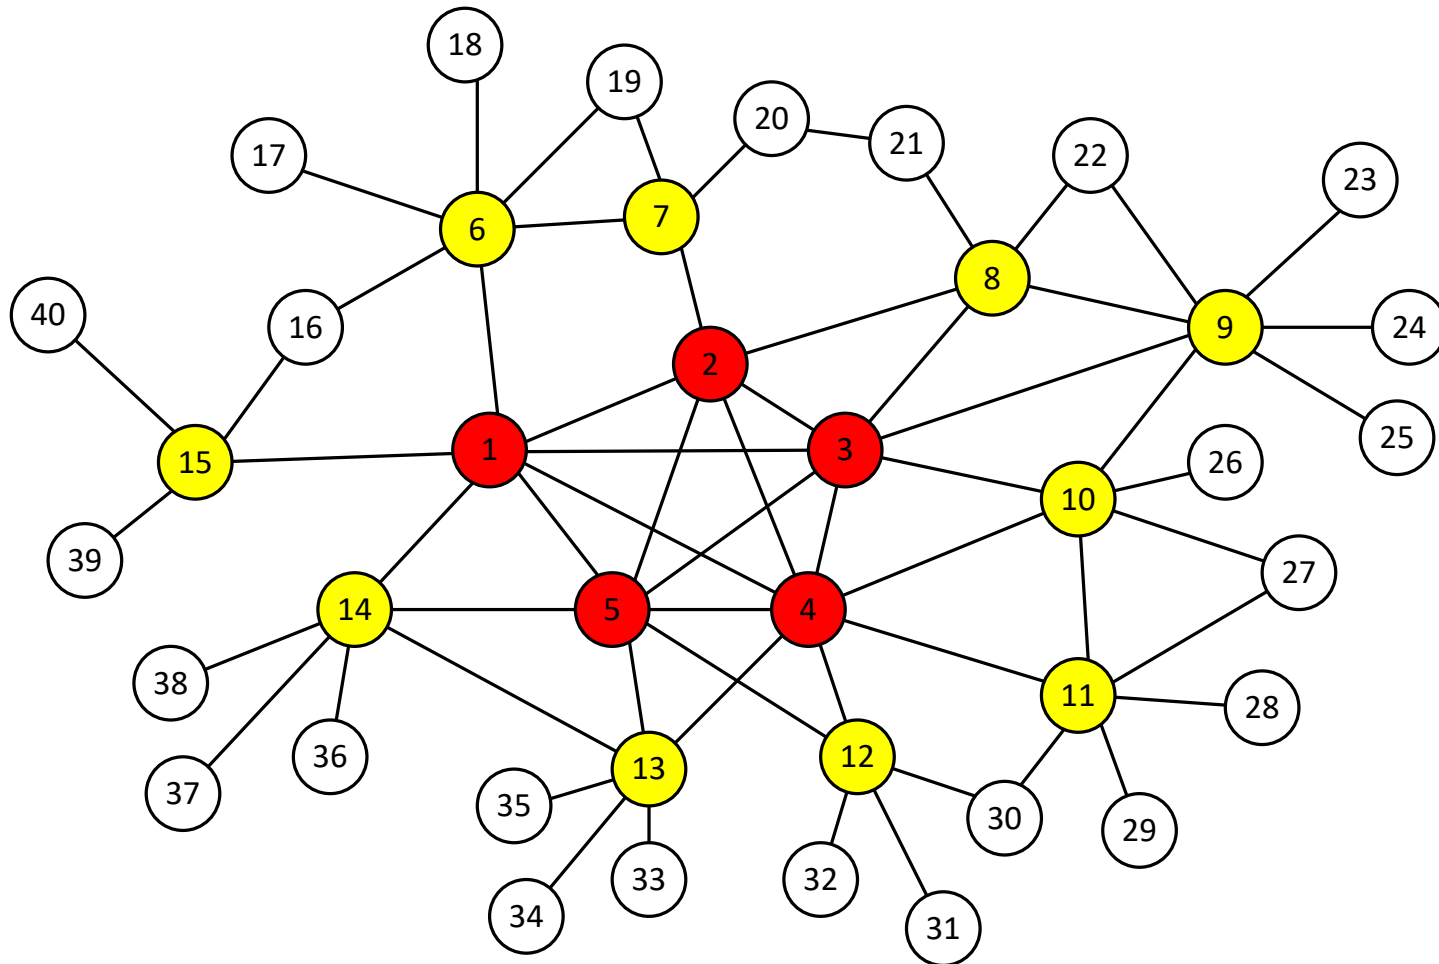

c_i – cost of the Internet connection to AS i , with $i = n_1, n_2, \dots$

$I(j)$ – set of Tier-2 and Tier-3 AS IDs such that there is a shortest path from AS j to each AS $i \in I(j)$ with at most one intermediate AS

VARIABLES:

x_i – binary variable, with $i = n_1, n_2, \dots$, that when is equal to 1 means that AS i must have a connected server farm

Server farm location problem: examples of sets $I(j)$

Set $I(j)$ for $j = 6$ is: $\{6, 7, 14, 15, 16, 17, 18, 19, 20\}$
for $j = 16$ is: $\{6, 7, 15, 16, 17, 18, 19, 39, 40\}$

Server farm location problem: ILP Model

$$\text{Minimize } \sum_{i=6}^{40} c_i x_i \quad (1)$$

Subject to:

$$\sum_{i \in I(j)} x_i \geq 1 \quad , j = 6, \dots, 40 \quad (2)$$

$$x_i \in \{0,1\} \quad , i = 6, \dots, 40 \quad (3)$$

- The objective (1) is the minimization of the total Internet connection costs on ASs with connected server farms.
- Constraints (2) guarantee that each AS j has at least one server farm connected to one AS $i \in I(j)$, i.e., one server farm whose shortest path has at most one intermediate AS.
- Constraints (3) define all variables as binary variables.
